

Seasonal Allergy Symptoms & Environmental Control

Seasonal allergic rhinitis (hay fever) causes sneezing, nasal congestion, runny nose, and itchy eyes triggered by outdoor pollens or indoor dust mites.

Self-Care Exposure Reduction: - Keep windows closed during high pollen counts; use air conditioning with clean filters. - Wash bedding in hot water weekly to reduce dust mite allergens. - Shower and change clothes after spending time outdoors during peak pollen seasons. - Use sterile saline nasal rinses to wash pollen from nasal passages.

Red Flags: Severe wheezing, facial swelling, or breathing difficulty require urgent clinical evaluation.

Indoor Allergen Management

Reducing indoor allergen triggers: - Use HEPA air purifiers in bedrooms. -
Maintain indoor humidity below 50% to prevent mold growth.

Saline Nasal Irrigation Practices

Saline rinses help flush out airborne allergens. Irrigation Instructions:

- Always use distilled, sterile, or previously boiled and cooled water. -
- Clean and dry irrigation devices thoroughly after each use.

Differentiating Allergies from Colds

Allergies typically cause itchy eyes/nose and last for weeks without fever. Colds often include body aches, fever, and resolve in 7-10 days.
