

Physical Activity Guidelines for Adults

Regular physical activity is one of the most important things adults can do to improve their overall health.

Adult Recommendations (Aged 18-64): - Aerobic Activity: At least 150 to 300 minutes of moderate-intensity aerobic physical activity (such as brisk walking) per week. - Muscle Strengthening: Engage in muscle-strengthening activities of moderate intensity involving all major muscle groups 2 or more days a week. - Reduce Sedentary Time: Move more and sit less throughout the day.

Safety Guidelines: Start slowly and gradually increase activity level over time. Listen to your body and rest if experiencing joint pain or extreme shortness of breath.

Health Benefits of Daily Movement

Physical activity reduces risks of hypertension, type 2 diabetes, depression, and improves sleep quality.

Activity Modifications for Beginners

For adults currently inactive, 10-minute sessions of light walking accumulate meaningful health benefits.

Safety Precautions During Physical Activity

Drink water before, during, and after exercise. Stop immediately if experiencing chest pain, dizziness, or pressure.
